
NetSend GUI Crack [Win/Mac]

NetSend GUI Crack License Key Full Free Download

Overview: NetSendGUI uses the NetSend protocol to send messages between computers. It is similar to any other program that runs on the PC that lets you send messages in the past, like the old "Net Send" program for example. NetSendGUI version 1.0 has now been turned into a full blown messenger application with all the extra features that had been added into a GUI like application.

With the NetSendGUI full featured release, you can save a address book of addresses into the program as contacts - as well as sending messages to them. Using this address book, you can select a contact and send a message - and it is also possible to have your system automatically send messages to selected contacts based on time/day/hour/minute/second of day etc. The address book is also saved so it can be reopened at a later time. An optional password can also be added for each contact which allows the contact to receive your messages even if you do not use the password. NetSendGUI uses the NetSend protocol so you do not need to have the NetSend application running to be able to send messages. Features: Address book: You can save contacts as in your address book. Also you can add a password to each contact to allow them to receive your messages even if you don't use the password. In a similar way to the My Messenger @ Microsoft, you can have NetSendGUI automatically send messages based on time/day/hour/minute/second of day etc. Messages can be sent to selected contacts by using the message format "j*b" where: j = a number between 1 and 10 * = the number in the contact you want to send the message to b = a number between 1 and 3 Example: *8 is a message to contact 8 Messages to contacts can also be set to be public or private. You can also delete contacts from the address book. There is also a Messages Summary window you can use to see if messages have been sent to and from each contact. View the address book: You can view the address book to see who each contact is, what their contact type is, what contact groups they are in etc. When you open the address book you can choose to add a contact to your address book - or you can select from the address book list. There is also a search window within the address book so you can search for contact names. View

NetSend GUI Download [Mac/Win] (Latest)

A fully featured GUI application for sending messages to the other computers on the network! Net Send is a command that sends messages to one or more computers at the same time. This is useful in many situations. For example, you may need to send an urgent message to several people, perhaps to warn them about something that's about to happen. Net Send can do this. If there are a few PCs on a network but you don't know all their names, using Net Send can be faster than typing

all the computers' names in the Message box. You may want to send messages about installing new software in the main server of the network (for example). One message could be sent to all the clients that request new software, and once the appropriate clients download and install the software, more messages can be sent individually to each PC telling it about the new software.

Alternatively, you may have a master PC that needs to know the names of all the PC's on the network. In this case, you may have created a list of computer names and their network addresses. If that list exists, messages can be sent to all the computers with a single command. Net Send also works with the Windows Mail and Windows Messenger services. With Messenger, you can send messages to multiple users at once. This allows you to send messages to your friends when you want to say "Look out - there's a fire in the sky!"

The application supports:

- Net Send entries in the Address Book
- Net Send files (files need to be in the standard.MSG format)
- Net Send the other properties associated with the address in the Address Book
- Net Send feedback - tells you if Net Send succeeded, failed, or failed to send the message
- Net Send Options - the usual options for Net Send you would expect
- Net Send Server - tells you if it can be started as a server
- Net Send Wizard - sets up Net Send for you from the command line
- Net Send Wizard - that sets up Net Send for you from the command line
- Net Send Unix - substitutes /dev/tcp (Unix TCP) for the corresponding TCP/IP port
- Net Send at a small startup delay
- Net Send Minimized to the System Tray
- Net Send clean memory - free up memory used by Net Send

A list of all the possible arguments to Net Send

Net Send with and without message file

Installer

You can also use the old Windows DOS net send command to send files via the network. What's nice about b7e8fdf5c8

NetSend GUI Crack + Serial Key [Mac/Win]

Clicking on the Send button opens a main window in which you type the command, address and other information as required. NetSend is actually a command that sends messages and can be used for adding and modifying addresses on a network. It is also used to send "noise" messages. The noise messages are short messages such as "Still here" or "Are you there?" The NetSend command was designed by Alan Watson who invented part of the graphics used in Microsoft Windows. Choosing the NetSend GUI On the left hand side you can see the taskbar and the System Tray icon. Clicking on the sent message will open the context menu for an easy way to send the message again in the future. The address book lets you add and maintain the addresses on the LAN. You need to use a computer with the NetSend GUI installed to access the address book. If you only have one computer then the address book on that computer will be available to all the other computers on the LAN. If you have multiple computers then you can share the address book with them. A record will only be available on a particular computer on the LAN. To add a record there you must type a network address in the "Address" section. You can then type in the message and also set the time to send it. You can send a message up to 30 minutes after entering it. Another way to create a record is by clicking on an existing record in the address book. The address will be copied and it can then be edited as normal. If you change the message you can click on the Send button to send it. If you click the Send button again it will be saved with the new message. To quit the command prompt please type "END" (without the quotes). To exit NetSend GUI you need to close the window manually. Windows may ask you if you want to exit and if you say yes it will close the window and release all the resources associated with it. To close the window, press Ctrl+F4. To quit completely you need to click on the "Quit" button. This will also close the window but not the application. To close the application completely you need to close the Task Manager (Windows+Task + Esc). Managing the Address Book The address book is located in the main window. Clicking on an entry in the address book will bring up a dialog in which the selected address will be highlighted and the messages you have sent to that address are listed.

What's New in the NetSend GUI?

NetSendGUI is a small application for sending text messages from one computer to another. NetSendGUI is written in Visual C++ and is designed to be as easy to use as possible. NetSendGUI is NOT a replacement for the Net Send command from the command line. Using NetSendGUI will just give you better information about whether the messages were sent successfully. Full Version Features One application Full support for the NetSend protocol Messenger Service support Supports copying of text from the application clipboard Messenger service supports standard net send messages or single-line messages Supports sending of unicode text messages to both Window and UNICODE compliant systems Sends text to the default email address or sends a text message to the user's junk email address File size (including file extension): 0.55 MB Network Send is a network sending program.
